

What I have read about experients in other countries such as Japan the use of power lines for broadband causes so much interference that they have disregared this as a useful means for broadband internet service. While I admire the FCC wish to provide this service to as many people as possible I beleive there are other ways to provide the service. I beleive that since the studies have already been made it would be a waste of our time and money to persue this any farther. I believe that since the Department of Homeland Security recently named amateur radio as one of the first of the first responders that the the FCC is more interesting in protecting the small allocation of radio spectrum given to the amateur community than it would be doing anything to destroy it. Thank you
